

Johnny (Protector of Little People) B. Strikes Again!

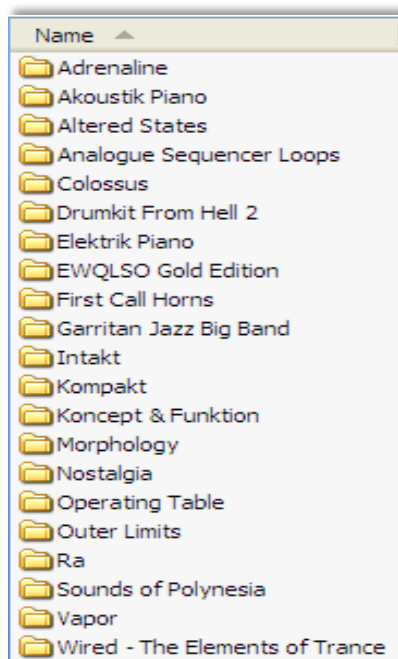

TIME TO GET YOUR KONTAKT 3 WORKING (AGAIN)

PLEASE READ THIS DOCUMENT FROM BEGINNING TO END BEFORE PROCEEDING TO GET A FULL UNDERSTANDING OF THE PROCEDURES INVOLVED. DON'T JUST GO DIVING IN IMPORTING THINGS INTO YOUR REGISTRY. YOU HAVE BEEN WARNED!

What you'll need to get your 3rd Party Kontakt Libraries or Romplers (as they're sometimes called) fully working again (ideally) are the stand alone players (cut down versions of the Kompakt / Kontakt / Intakt players, which come with the libraries) and the Registration Tool.exe files which come with the libraries.

I've included in the RAR file, registration tool exe files for 21 libraries and the "content" registry branches for these libraries, which should get some going if you only have the libraries. You'll have to hunt down the registration tools exe files and ask your friends for their "content" branch entries for the products you have (which aren't listed here), if you don't have the full products installed (I.E you only have the libraries).

Included are:

RAR File Contents

- 1) The folder “Registration Tool EXE Files” contains the registration tool exe files and keygens or serials for the products listed above.
- 2) The file “**SOME_COMMON_CONTENT_ENTRIES.REG**” in that folder contains the correct “content” branch entries for the above products (plus some others which you won’t need that are redundant from products I have uninstalled). All will be explained on the next page. Please **READ IT THOROUGHLY. DO NOT** just import this file into your registry; rather use it to create “Content” entries manually.
- 3) The folders “AP Version 1 Default” and “AP Version 1 Presets” and “EP Version 1 Instruments” and “EP Version 1 Performances” contain .nki instrument patches (only) from Acoustic Piano version 1 and Electric Piano version 1 respectively. The only libraries (or instrument patches, to be more specific) which I could not get working in Kontakt 3 were the latest Electric Piano 1.5 and Acoustic Piano 1.1 patches. The libraries themselves were still accessible down to sample level. I have a feeling this is because the new instrument patches included in the updates are protected and have special password protected scripts. For that reason I have included the old version 1 patches for Electric Piano and Acoustic piano which you can use to load the old instrument patches for those 2 products into Kontakt 3. Just copy those two folders into your library folders for those products and use them instead of the new patches. Then at least you’ll be able to use Electric Piano and Acoustic Piano in Kontakt 3 until something better comes along.
- 4) “**KEYGEN FOR AUTHORISATION CODE.EXE**” - The all important “H20” 2.02 All Products keygen.
- 5) “**THE KNOWLEDGE.PDF**” – This document.

OK, so let’s get this shit down.

Firstly, bare in mind the following statements. The latest versions of Kontakt 2 and Kontakt 3 need only 2 things to open 3rd party libraries correctly.

1) A correct entry in: “HK_CURRENT_USER\Software\Native Instruments\Content”

This is created when the cut down stand alone player which came with the library first runs (which is why you could really do with it – for products other than the ones I’ve included anyway). These entries are exactly the same across all systems. The registry “keys” can be numbered how you like, but the entries are the same. For example:

“0000fpx” = “3802858496”

“0000rbk” = “PSP Wired - The Elements Of Trance”

Is also quite valid as:

“0001fpx” = “3802858496”

“0001rbk” = “PSP Wired - The Elements Of Trance”

The only thing that determines if a product is “0000”, “0001”, “0003” etc. Is the order you installed the products in.

But the “3802858496” and the “PSP Wired - The Elements Of Trance” bits are exactly the same on both yours and my system. That’s why I’ve included the ones I can find.

2) And a good “KEY” and “SYSTEMID” entry in:

“HK_CURRENT_USER\Software\Native Instruments\<PRODUCT>”

which are provided by the included keygen and the registration tools.

That’s all.

PLEASE READ ALL OF THE FOLLOWING SCENARIOS AND CHOOSE WHICH ONE IS BEST FOR YOU AFTER YOU’VE READ THEM AND UNDERSTAND THE CONCEPT OF WHAT I’M ASKING YOU TO DO.

Scenario Number 1 Fix

This scenario assumes you have the full products installed with the registration tool exe files and the stand alone players, but you replaced all your “Content” entries with “Kontakt2” to get them working with older versions and can’t remember your correct “Content” entries. (And they’re not in my list either).

- 1) Export your entire “HK_CU\Software\Native Instruments” branch as a backup. Save it to your desktop as “HK_CU_NI.REG” you’ll need to import it back for this next bit anyway, because we’re going to fuck things up on purpose.

For fucks sake, **DO NOT SKIP POINT ONE.**

- 2) Delete the entire “HK_CU\Software\Native Instruments\Content” branch from your registry (it’s OK you backed it up in point 1!).
- 3) Go to the “HK_CU\Software\Native Instruments\<PRODUCT>” branch and look for the SNO field. That’s the serial number. Copy it into NOTEPAD or write it down, it’s still valid so we can re-use this.
- 4) Delete the entire “HK_CU\Software\Native Instruments\<PRODUCT>” branch from your registry. <PRODUCT> being the 3rd party library you want to get working of course. (Again it’s OK you backed it up in point 1!).
- 5) Run the “Product Registration.exe” of the 3rd party library you want to get running. Enter the serial number you copied from point 3. Use the “second part” of the H20 keygen I’ve included “KEYGEN FOR AUTHORISATION CODE.EXE” to generate a valid “AUTHORISATION KEY”. Complete the registration. (**DON’T USE THIS KEY FOR SERIALS!**).
- 6) Run the “Stand Alone” player. Because no registry entries for the product exist it will re-create the correct all important entry in “HK_CU\Software\Native Instruments\Content”. It will also crash – **THAT’S OK**. So just close it.
- 7) Go into the registry and write down or export **BOTH** the new entries in “HK_CU\Software\Native Instruments\Content”. We’re going to overwrite them so you’ll need to.
- 8) Import the “HK_CU_NI.REG” backup you made. Everything is back to normal. However, now we have a valid “Content” entry for **YOUR** product.
- 9) Go to the “HK_CU\Software\Native Instruments\Content” and match the number you wrote down or exported in point 7 to the one in the “Content” branch. Change the entry of the text in the field below it from your “Kontakt2” entry, to match the text of the field you exported in point 7 exactly. For example:

Your old entry:

“0000fpx” = 3802858496

“0000rbk” = “Kontakt 2”

Becomes:

“0000fpx” = 3802858496

“0000rbk” = “PSP Wired - The Elements Of Trance”

If you can't find it, just add two other entries to the list, remember the “0000fpx” and “0000rbk” bit isn't important. They can be:

“0033fpx” = 3802858496

“0033rbk” = “PSP Wired - The Elements Of Trance”

Now, remember we've restored the old “KEY” and “SYSTEMID” fields in point 8. So we need to crack the actual product with the good keygen again. It's a bit simpler this time though.

Simply delete the CONTENTS ONLY of the fields (not the fields themselves!):

“HK_CU\Software\Native Instruments\<PRODUCT>\KEY”

“HK_CU\Software\Native Instruments\<PRODUCT>\SYSTEMID”

So they are empty. Run the registration tool for the product again and use the “second part” of the included keygen to generate a valid AUTHORISATION KEY for your system. (DON'T USE THIS KEY FOR SERIALS!).

That's it. Your done. Run the standalone product and make sure that works OK. Then use Kontakt 2 or Kontakt 3's “FILE BROWSER WINDOW ONLY” to test the 3rd party library now loads OK in Kontakt. Please be aware that the database view will still not work until you do a complete rebuild of the Kontakt database, as the database records the old access information at the point of scanning. I'd leave that right until last once you know all your products are working OK.

Go back to point 1 and do that for ALL your secured kontakt libraries.

DON'T FORGET TO DO THE BACKUP AGAIN IN POINT 1! DON'T USE THE OLD BACKUP YOU MADE, OTHERWISE YOU'LL JUST UNDO WHAT YOU DID.

IT IS PROBABLY A GOOD IDEA TO KEEP THE ORIGINAL COPY OF THIS ANYWAY JUST IN CASE YOU SHAG THINGS UP!

Scenario Number 2 Fix

You have everything installed OK including the standalones and the registration tools. You never touched your “Content” branch. You just used the wrong keygen to authorise the products or the “cracker” used a code which doesn’t seem to work.

Easy this one.

- 1) Export your entire “HK_CU\Software\Native Instruments” branch as a backup. Save it to your desktop as “HK_CU_NI.REG”.**

Just in case you mess anything up.

- 2) Simply delete the CONTENTS ONLY of the fields (not the fields themselves!):**

**“HK_CU\Software\Native Instruments\<PRODUCT>\KEY”
“HK_CU\Software\Native Instruments\<PRODUCT>\SYSTEMID”**

So they are empty. Run the registration tool for the product again and use second part of the included “KEYGEN FOR AUTHORISATION CODE.EXE” keygen to generate a valid “AUTHORISATION KEY” for your system id. Do NOT use this keygen for the SERIAL NUMBER.

THERE SHOULD BE NO NEED TO ENTER A NEW SERIAL NUMBER, AS THE ONE ALREADY IN THE “SNO” FIELD SHOULD BE VALID. YOU SHOULDN’T BE PROMPTED FOR THIS WHEN YOU RUN THE REGISTRATION TOOL. IT WILL SAVE YOU HAVING TO HUNT DOWN ANY OTHER KEYGEN.

That’s it. Your done. Run the standalone product and make sure that works OK. Then use Kontakt 2 or Kontakt 3’s “FILE BROWSER WINDOW ONLY” to test the 3rd party library now loads OK in Kontakt. Please be aware that the database view will still not work until you do a complete rebuild of the Kontakt database, as the database records the old access information at the point of scanning. I’d leave that right until last once you know all your products are working OK.

Scenario Number 3 Fix

You only have protected databases. You never thought you'd need the registration tool or standalones so you deleted them or you never had them in the first place.

Unfortunately you need the registration tool.exe files that came with the products. I have included what I can. The other's you'll have to ask other people for or re-download. If you get them from someone else, also be sure to ask them to kindly check their "content" registry entries for that product as well.

You will need to create a valid entry pair in registry location:

"HK_CU\Software\Native Instruments\Content"

"0000fpx" = 3802858496

"0000rbk" = "PSP Wired - The Elements Of Trance"

and

"0033fpx" = 3802858496

"0033rbk" = "PSP Wired - The Elements Of Trance"

Are both totally valid. The "0000" number isn't important.

"0033fpx" = 3802858496

"0033rbk" = "Kontakt2"

Isn't valid any longer. That's one of the reasons your being locked out.

Look at my "Content" entries included in the file:

"SOME_COMMON_CONTENT_ENTRIES.REG"

Enter the ones you have into the **"HK_CU\Software\Native Instruments\Content"** branch of the registry. Then run the registration tool.exe's files I've included for those products and they **SHOULD** work. I've also included the keygen's or serials for those products in the same folder. **ONLY USE THE KEYGENS TO GENERATE SERIAL NUMBERS. USE THE SECOND PART OF THE KEYGEN CALLED "KEYGEN FOR AUTHORISATION CODE.EXE" TO GENERATE A VALID AUTHORISATION RESPONSE CODE WHICH WILL BE COMPATIBLE WITH THE LATEST VERSIONS OF KONTAKT 2!**
